

## Lichen Sclerosus, reduction of symptoms within a month

The study assessed the efficiency of DermaSilk® in comparison with cotton in women suffering from vulvar Lichen Sclerosus.

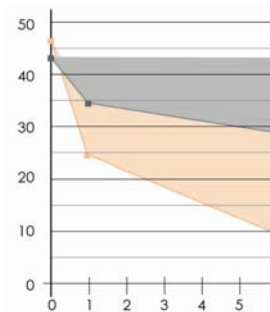

Symptoms such as itching, pain, burning, dryness and dyspareunia - typical of the most widespread vulvar pathologies - were drastically reduced already within the first month when using DermaSilk®. At the end of the study, 5 months later, the improvement obtained in the DermaSilk® group was much more marked than in the Cotton group (following the same therapy), leading in many cases to the disappearance of the symptoms.

*"All patients declared that they wanted to continue using DermaSilk®, even after the observation period."*
